The goal of this examination is to check the relationship among endometriosis and preterm birth through precise audit and meta-investigation. Is there an expanded danger of untimely birth in ladies with endometriosis contrasted with ladies without this determination? The information bases looked were PubMed, Medline, and LILACS to distinguish all investigations distributed up to April 2020, utilizing the watchwords (rashness OR preterm birth OR untimely birth OR untimely work OR obstetric untimely work OR preterm work OR untimely obstetric work) AND (endometriosis OR adenomyosis OR endometrioma OR endometriomas). A manual examination was additionally performed through the investigation of theories, book parts, reference references, rules, and audits. All distributed imminent partner considers that revealed the commonness of preterm conveyance among ladies with endometriosis, adenomyosis, or endometrioma were incorporated, contrasting it with the benchmark group of ladies without such findings. The irregular impacts model, the estimation of relative danger, and the certainty time frame were utilized to play out the meta-examination. Three examinations including 10,111 patients were incorporated. Contrasted with ladies without endometriosis, ladies with endometriosis present an expanded danger of untimely birth (RR: 2.68, 95% CI [1.19; 6.02], I<sup>2</sup>=91%). In the subgroup of ladies with unconstrained origination, endometriosis is additionally a danger factor for rashness (RR: 3.26, 95% CI [2.09; 5.09], I<sup>2</sup>=0%, 2 investigations, 682 members).
